Prepared in cooperation with the States of Maryland and Delaware and with other agencies.

16. Abstract (Limit: 200 words)

Water resources data for the 1971 water year for Maryland and Delaware consist of records of discharge and water quality of streams, and water quality of lakes and reservoirs. This report contains water quality for 45 gaging stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating local, State, and Federal agencies in Maryland and Delaware.

WATER RESOURCES DATA FOR MARYLAND AND DELAWARE, 1971

Part 2. Water Quality Records

INTRODUCTION

Water resources data for the 1971 water year for Maryland and Delaware include records of data for the chemical and physical characteristics of surface water. Data on the quality of surface water (chemical, temperature, and sediment) were collected from designated sampling sites at predetermined intervals such as once daily, weekly, monthly or less frequently, and at some sites data were recorded on punched paper tape at 15-, 30-, or 60-minute intervals. Locations of surface water-quality stations are shown in Figure 1. A few pertinent stations (not included above) in bordering States are also included. The records were collected by the Water Resources Division of the U.S. Geological Survey under the direction of W. F. White, district chief, Parkville, Md., and N. H. Beamer, district chief, Harrisburg, Pa. These data represent that portion of the National Water Data System collected by the U. S. Geological Survey and cooperating State and Federal agencies in Maryland and Delaware.

The Geological Survey has published records of chemical quality, water temperatures, and sediment since 1941 in an annual series of water-supply papers entitled, "Quality of Surface Waters of the United States." Beginning with the 1964 water year, water-quality records have been released by the Geological Survey in annual reports on a State-boundary basis. These reports are for limited distribution and are designed primarily for rapid release of data shortly after the end of the water year. These records will be published later in Geological Survey water-supply papers.

COOPERATION

This report was prepared by the U. S. Geological Survey under cooperative agreement with the following organizations:

Delaware Geological Survey, R. R. Jordan, State geologist.

Maryland Geological Survey, K. N. Weaver, director.

Maryland National Capital Park and Planning Commission, J. P. Hewitt, executive director.

Washington Suburban Sanitary Commission, R. J. McLeod, general manager.

District of Columbia Department of Environmental Services (formerly Department of Sanitary Engineering), J. P. Alexander, director.

Assistance in the form of funds was given by the Water Quality Office, Environmental Protection Agency (formerly Federal Water Pollution Control Administration) for the collection of chemical analyses of 19 stream-sampling stations in this report.

Assistance was also furnished by Soil Conservation Service, U. S. Department of Agriculture.

DEFINITION OF TERMS

Terms related to water-quality and hydrologic data, as used in this report are defined below. See also list of factors for converting English Units to International System (SI) Units on page 14.

Cfs-day is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, approximately 1.9835 acre-feet, or about 646,000 gallons, and represents a runoff of approximately 0.0372 inches from 1 square mile.

Coliform organisms are a group of bacteria used as an indicator of the sanitary quality of the water. The number of coliform colonies per 100 milliliters is determined by the immediate or delayed incubation membrane filter method.

Cubic foot per second (cfs, CFS) is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to 7.48 gallons per second or 448.8 gallons per minute.

Discharge is the volume of water (or more broadly, total fluids), that passes a given point within a given period of time.

Mean discharge is the arithmetic mean of individual daily mean discharges during a specific period.

Instantaneous discharge is the discharge at a particular instant of time. If this discharge is reported instead of the daily mean, the heading of the discharge column in the tables is "Discharge (cfs)."

Drainage area of a stream at a specified location is that area, measured in horizontal plane, enclosed by a topographic divide from which direct surface runoff from precipitation normally drains by gravity into the river above the specified point.

Drainage basin is a part of the surface of the earth that is occupied by a drainage system, which consists of a surface stream or body of impounded surface water together with all tributary surface streams and bodies of impounded surface water.

Gaging station is a particular site on a stream, canal, lake, or reservoir where systematic observations of gage height or discharge are obtained. When used in connection with a discharge record, the term is applied only to those gaging stations where a continuous record of discharge is computed.

Hardness of water is a physical-chemical characteristic attributable to the presence of alkaline earths (principally calcium and magnesium) and is expressed as equivalent calcium carbonate ($CaCO_3$).

Methylene blue active substance (MBAS) is a measure of apparent detergents. This determination depends on the formation of a blue color when methylene blue dye reacts with synthetic detergent compounds.

Micrograms per liter (ug/l, UG/L) is a unit expressing the concentration of chemical constituents in solution as weight (micrograms) of solute per unit volume (liter) of

water. One thousand micrograms per liter is equivalent to one milligram per liter.

Milligrams per liter (mg/l, MG/L) is a unit for expressing the concentration of chemical constituents in solution. Milligrams per liter represents the weight of solute per unit volume of water. Milligrams or micrograms per liter may be converted to milliequivalents (one thousandth of a gram-equivalent weight of a constituent) per liter by multiplying by the factors in table 1, page 6. Concentration of suspended sediment also is expressed in mg/l, and is based on the weight of sediment per liter of water-sediment mixture. Sediment concentrations may be converted to parts per million by using the factors in table 2, p. 5.

Partial-record station is a particular site where limited streamflow or water-quality data are collected systematically over a period of years for use in hydrologic analyses.

Particle-size is the diameter, in millimeters (mm), of suspended sediment or bed material determined either by sieve or sedimentation methods. Sedimentation methods (pipet), bottom-withdrawal tube, visual-accumulation tube) determine fall diameter of particles in either distilled water (chemically dispersed) or in native water (the river water at the time and point of sampling) (Guy, 1969).

Particle-size classification, used in this report agrees with recommendations made by the American Geophysical Union Subcommittee on Sediment Terminology. The classification is as follows:

Classification	Size (mm)	Method of analysis
Clay.....	0.00024 - 0.004	Sedimentation.
Silt.....	.004 - .062	Sedimentation.
Sand.....	.062 - 2.0	Sedimentation or sieve.
Gravel.....	2.0 - 64.0	Sieve.

The particle-size distributions given in this report are not necessarily representative of all particles in transport in the stream. Most of the organic material is removed and the sample is subjected to mechanical and chemical dispersion before analysis in distilled water. Chemical dispersion is not used for native-water analysis (Guy, 1969). All particle size analyses in this report were performed in distilled water and chemically dispersed unless noted otherwise.

Table 1.--Factors for conversion of chemical constituents in milligrams or micrograms per liter to milliequivalents per liter

Ion	Multiply by	Ion	Multiply by
Aluminum (Al^{+3})*	0.11119	Iodide (I^{-1})	0.00788

*Based on water density of 1.000 g/ml and a specific gravity of sediment of 2.65.

Sediment is solid material that originates mostly from disintegrated rocks and is transformed by, suspended in, or deposited from water; it includes chemical and biochemical precipitates and decomposed organic material such as humus. The quantity, characteristics, and cause of the occurrence of sediment in streams are influenced by environmental factors. Some major factors are degree of slope, length of slope, soil characteristics, land usage, and quantity and intensity of precipitation.

Suspended sediment is the sediment that at any given time is maintained in suspension by the upward components of turbulent currents or that exists in suspension as a colloid.

Suspended-sediment discharge is the rate at which dry weight of sediment passes a section of a stream or is the quantity of sediment, as measured by dry weight, or by volume, that is discharged in a given time. It is computed by multiplying discharge times mg/l times 0.0027.

Total sediment discharge or total sediment load is the sum of the suspended-sediment discharge and the bedload discharge. It is the total quantity of sediment, as measured by dry weight or volume, that is discharged during a given time (Colby and Hembree, 1955).

Suspended-sediment concentration is the velocity-weighted concentration of suspended sediment in the sampled zone (from the water surface to a point approximately 0.3 ft above the bed) expressed as milligrams or dry sediment per liter of water-sediment mixture (mg/l).

Mean concentration is the time-weighted concentration of suspended sediment passing a stream section during a 24-hour day.

Solute is any substance derived from the atmosphere, vegetation, soil, or rocks that is dissolved in water.

Specific conductance is a measure of the ability of a water to conduct an electrical current and is expressed in micromhos per centimeter at 25°C. Because the specific conductance is related to the number and specific chemical types of ions in solution, it can be used for approximating the dissolved-solids content in the water. Commonly, the amount of dissolved solids (in milligrams per liter) is about 65 percent of the specific conductance (in micromhos). This relation

is not constant from stream to stream, and it may even vary in the same source with changes in the composition of the water.

Streamflow is the discharge that occurs in a natural channel. Although the term "discharge" can be applied to the flow of a canal, the word "streamflow" uniquely describes the discharge in a surface stream course. The term "streamflow" is more general than "runoff." Streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Thermograph is a thermometer that continuously and automatically records, on a chart, the water temperature of a stream. "Temperature recorder" is the term used to indicate the location of the thermograph or a digital mechanism that automatically records water temperature on paper tape.

DOWNSTREAM ORDER AND STATION NUMBER

Stations are listed in downstream direction along the main stream, and stations on tributaries are listed between stations on the main stream in the order in which those tributaries enter the main stream. Stations on tributaries entering above all mainstream stations are listed before the first mainstream station. Stations on tributaries to tributaries are listed in a similar manner. In the list of water-quality stations in the front of this report the rank of tributaries is indicated by indention, each indention representing one rank.

As an added means of identification, each water-quality station, gaging station, and partial-record station has been assigned a station number. These are in the same downstream order used in this report. In assigning station numbers, no distinction is made between partial-record and continuous-record stations; therefore, the station number for a partial-record station indicates downstream order position in a list made up of both types of stations. Water-quality stations located at or near gaging stations or partial-record stations have the same number as the gaging or partial-record station. Gaps are left in the numbers to allow for new stations that may be established; hence the numbers are not consecutive. The complete 8-digit number for each station, such as 01481500 which appears just to the left of the station name includes the 2-digit part number "01" plus the 6-digit downstream order number "481500." In this report the records are listed in downstream order by parts. The part number refers to an area whose boundaries coincide with certain

natural drainage lines. Records in this report are in Part 1 (North Atlantic Slope basins) and Part 3 (Ohio River basin). The station numbers shown on Figure 1 are the first four digits of the downstream order number plus the fifth or the fifth and sixth digits when required to distinguish the stations.

COLLECTION AND EXAMINATION OF DATA

Water samples for analyses usually are collected at or near gaging stations. The discharge records at these stations are used in conjunction with the computations of the chemical constituents and sediment loads. Discharge records for streams in Maryland and Delaware have been released in the report, "Water Resources Data for Maryland and Delaware, 1970, Part 1. Surface Water Records.

The data in this report include a description of the sampling station and tabulations of the samples analyzed. The description of the sampling station gives the location, drainage area, periods of record for the various water-quality data, extremes of the pertinent data, and general remarks, in a format similar to that used for streamflow gaging stations.

Water-quality information is presented for chemical quality, microbiological, water temperature, and fluvial sediment. Chemical quality includes concentrations of individual dissolved constituents and certain properties or characteristics such as hardness, specific conductance, and pH. Microbiological information includes quantitative identification of certain bacteriological indicator organisms. Water-temperature data represent once-daily observations except for stations where a continuous temperature recorder furnished information from which daily minimums and maximums are obtained. Fluvial-sediment information is given for suspended-sediment discharges and concentrations and for particle-size distribution of suspended sediment.

Prior to the 1968 water year, data for chemical constituents and concentrations of suspended sediment were reported in parts per million (ppm) and water temperatures were reported in degrees Fahrenheit (°F). In October 1967, the U.S. Geological Survey began to use the metric system; data for chemical constituents and concentrations of suspended sediment are now reported in milligrams per liter (mg/l) and water temperatures are given in degrees Celsius (centigrade, °C). In waters with a density of 1.000 g/ml

(grams per milliliter), parts per millions and milligrams per liter can be considered equal. In waters with a density greater than 1.000 g/ml, values in parts per million should be multiplied by the density to convert to milligrams per liter. To convert temperature in degrees Celsius to degrees Fahrenheit, see table 3 below.

Table 3.--Degrees Celsius (°C) to degrees Fahrenheit (°F)*
(Temperature reported to nearest 0.5°)

°C	°F	°C	°F	°C	°F	°C	°F	°C	°F
0.0	32	10.0	50	20.0	68	30.0	86	40.0	104

9.5	49	19.5	67	29.5	85	39.5	103	49.5	121

*C = 5/9 (°F -32) or °F = 9/5 (°C) + 32

In October 1968, the Geological Survey began reporting many of the chemical constituents as well as the minor elements in micrograms per liter instead of milligrams per liter (See "Definitions of Terms," p. 4.)

Solutes

The methods of collecting and analyzing water samples for determing the kinds and concentrations of solutes are described by Brown, Skougstad, and Fishman (1970). One sample can define adequately the water quality at a given time if the mixture of solutes throughout the stream cross section is

homogeneous. However, the concentration of solutes at different locations in the cross section may vary widely with different rates of water discharge depending on the source of material and the turbulence and the mixing of the stream. Some must be sampled at several verticals across the channel to determine accurately the solute load.

Temperature

Water temperatures are measured at most of the water-quality stations. For daily stations, the water temperatures are taken at about the same time each day when sample is collected. Large streams have a small diurnal temperature change; shallow streams may have a daily range of several degrees and may follow closely the changes in air temperature. Some streams may be affected by waste-heat discharges.

At stations where continuously recording thermographs are present, the records consist of maximum and minimum temperatures for each day.

Sediment

Suspended-sediment concentrations are determined from samples collected by using depth-integrating samplers. Samples usually are obtained at several verticals in the cross-section, or a single sample may be obtained at a fixed point and a coefficient applied to determine the mean concentration in the cross sections.

During periods of rapidly changing flow or rapidly changing concentration, samples may have been collected more frequently (twice daily or, in some instances, hourly). The published sediment discharges for days of rapidly changing flow or concentration were computed by the sub-divided day method (time-discharge weighted average). Therefore, for those days when the published sediment discharge value differs from the value computed as the product of discharge times mean concentration times 0.0027, the reader can assume that the sediment discharge for that day was computed by the sub-divided day method. For periods when no samples were collected, daily loads of suspended sediment were estimated on the basis of water discharge, sediment concentrations observed immediately before and after the periods, and suspended-sediment loads for other periods of similar discharge.

At other stations, suspended-sediment samples were collected periodically at many verticals in the stream cross

section. Although data collected periodically may represent conditions only at the time of observations, such data are useful in establishing seasonal relations between quality and streamflow in predicting long-term sediment-discharge characteristics of the stream.

In addition to the records of the quantities of suspended sediment, records of the periodic measurements of the particle-size distribution of the suspended sediment are included.

PUBLICATIONS

The annual series of water-supply papers that give information on quality of surface waters in Maryland and Delaware are listed below.

	Mass	
ton (short)	.9072	tonne (t)

*The unit hectare is approved for use with the International System (SI) for a limited time. See NBS Special Bulletin 330, p.15, 1972 edition.

**The unit liter is accepted for use with the International System (SI). See NBS Special Bulletin 330, p. 13, 1972 edition.

DELAWARE BAY

01412350 DELAWARE BAY AT SHIP JOHN SHOAL LIGHTHOUSE, N. J.

LOCATION.--Lat 39°18'19", long 75°22'37", Cumberland County, water-quality recorder on light ship in bay opposite Bombay Hook Island, Del., and 3 miles south southwest of mouth of Cohansey River, N. J.

PERIOD OF RECORD.--Chemical analyses: April 1969 to September 1971.
Water temperatures: March 1970 to September 1971.

01480000 RED CLAY CREEK AT WOODDALE, DEL.

LOCATION.--Lat 39°45'52", long 75°38'06", New Castle County, temperature recorder at gaging station on right bank 12 ft upstream from bridge on State Highway 48, 0.3 mile south of Wooddale, 2.5 miles north of Marshallton, and 4.9 miles upstream from mouth.

DRAINAGE AREA.--47.0 sq mi.

PERIOD OF RECORD.--Water temperatures: April 1953 to September 1971.

EXTREMES.--1970-71:
Water temperatures: Maximum, 26.0°C July 10, 29; minimum, 0.5°C on many days during January and February.

Period of record:
Water temperatures: Maximum, 30.5°C July 17, Aug. 2, 6, 1955, July 19, 1963; minimum, freezing point on many days during winter period.

01481000 BRANDYWINE CREEK AT CHADDS FORD, PA.

LOCATION.--Lat 39°52'09", long 75°38'36", Delaware County, at gaging station located on left bank 27 ft upstream from Pennsylvania Railroad Bridge at Chadds Ford, and 1,200 ft downstream from highway bridge on U. S. Highway 1. Sediment samples collected at U. S. Highway 1 bridge.

DRAINAGE AREA.--287 sq mi.

PERIOD OF RECORD.--Chemical analyses: March 1964 to September 1971.
Water temperatures: October 1964 to September 1971.
Sediment records: July 1965 to September 1971.

EXTREMES.--1970-71:
Sediment concentrations: Maximum daily, 730 mg/l Feb. 13; minimum daily, 2 mg/l Feb. 4.
Sediment discharge: Maximum daily, 10,700 tons Feb. 13; minimum daily, 1.4 tons Feb. 4.

Period of record:
Specific conductance (1965-71): Maximum daily, 285 micromhos Sept. 2, 3, 1966, Mar. 4, 1969; minimum daily, 122 micromhos Aug. 10, 1967.
Water temperatures: Maximum daily, 29.0°C Aug. 9, 17, 1965; minimum, freezing point on many days during winter months.
Sediment concentrations: Maximum daily, 2,000 mg/l (estimated) Feb. 8, 1965; minimum daily, 1 mg/l on several days in 1964, 1966 to 1969.
Sediment discharge: Maximum daily, 20,000 tons (estimated) Feb. 8, 1965; minimum daily 0 tons Oct. 7, 8, 1967.

REMARKS.--Unpublished records of specific conductance, pH, and temperature of sediment samples available in the WRD district office at Harrisburg, Pa.

01481500 BRANDYWINE CREEK AT WILMINGTON, DEL.

LOCATION.--Lat 39°46'09", long 75°34'25", New Castle County, at gaging station on right bank in Rockford Park, 0.2 mile downstream from Henry Clay Bridge, in Wilmington, and at mile 4.2. Sediment samples are collected at the Henry Clay Bridge.

DRAINAGE AREA.--314 sq mi.

PERIOD OF RECORD.--Chemical analyses: October 1947 to September 1960, November 1961 to September 1962, October 1966 to September 1971.
Water temperatures: November 1956 to September 1961.
Sediment records: December 1946 to September 1961, July 1962 to September 1971.

EXTREMES.--1970-71:
Sediment concentrations: Maximum daily, 1,270 mg/l Feb. 14; minimum daily, 3 mg/l on Mar. 25, 29, 31, Sept. 10.
Sediment discharge: Maximum daily, 55,700 tons Feb. 14; minimum daily, 1.60 tons Aug. 24, 25.

Period of record:
Water temperatures (1956-61): Maximum, 30.0°C June 17, 1957; minimum, freezing point on many days during winter period.
Sediment concentrations: Maximum daily, 1,700 mg/l Feb. 14, 1966; minimum daily, 1 mg/l on many days.
Sediment discharge: Maximum daily, 55,000 tons Feb. 14, 1966; minimum daily, less than 0.50 ton on many days.

REMARKS.--Published and unpublished chemical-quality data and specific conductance, pH, and temperature of sediment samples available in WRD office at Parkville, Md.

01482100 DELAWARE RIVER AT DELAWARE MEMORIAL BRIDGE, NEAR WILMINGTON, DEL.

LOCATION.--Lat 39°41'18", long 75°31'06", New Castle County, at center of the navigational channel at bridge between Pigeon Point, Del. and Deepwater Point, N. J. Water-quality recorder (39°41'21", 75°31'19") at tidal gaging station located on channel side of west tower of south bridge.

DRAINAGE AREA.--11,030 sq mi.

PERIOD OF RECORD.--Chemical analyses: July 1955 to September 1971.
Water temperatures: October 1956 to September 1971.

EXTREMES.--1970-71:
Specific conductance: Maximum, 8,120 micromhos Oct. 14; minimum, 100 micromhos Sept. 13-14.
Dissolved oxygen: Maximum, 12.3 mg/l Jan. 28; minimum, 0.1 mg/l on several days during June and September.
Water temperatures: Maximum, 28.0°C Aug. 10; minimum, freezing point on several days during winter months.

Period of record:
Specific conductance: Maximum, 14,600 micromhos Oct. 6, 1957; minimum, 100 micromhos on several days during the spring of most years.
Water temperatures: Maximum, 31.0°C Aug. 9, 1968; minimum, freezing point on many days during winter months.

REMARKS.--Samples collected approximately 3 feet from surface. Records of discharge are available for 01463500 Delaware River at Trenton, N. J. in, "Water Resources Data for New Jersey, Part 1, Surface Water Records."

01482800 DELAWARE RIVER AT REEDY ISLAND JETTY, DEL.

LOCATION.--Lat 39°30'05", long 75°34'07", New Castle County, water-quality recorder located on platform about 0.4 mile downstream from Reedy Island near Port Penn.

DRAINAGE AREA.--11,222 sq mi, approximately.

PERIOD OF RECORD.--Chemical analyses: October 1963 to September 1971

EXTREMES.--1970-71:
Specific conductance: Maximum, 17,720 micromhos Oct. 2; minimum, 400 micromhos Sept. 15, 18.
Dissolved oxygen: Minimum, 0.3 mg/l Sept. 16-17.
Water temperatures: Maximum, 27.0°C Aug. 1.
pH: Maximum, 8.3 Aug. 31, Sept. 14; minimum, 6.0 Aug. 20.

Period of record:
Specific conductance: Maximum, 35,400 micromhos Nov. 7, 1963; minimum, 100 micromhos on several days in 1969 and 1970
Dissolved oxygen (1970-71): Maximum, 12.8 mg/l Feb. 14, 1970; minimum, 0.3 mg/l Sept. 16-17, 1971.
Water temperatures (1970-71): Maximum, 28.5°C Aug. 2, 1970.
pH (1970-71): Maximum, 8.3 Aug. 31, Sept. 14, 1971; minimum, 6.0 Aug. 20, 1971.

01595500 NORTH BRANCH POTOMAC RIVER AT KITZMILLER, MD.

LOCATION.--Lat 39°23'38", long 79°10'55", Garrett County, temperature recorder at gaging station on left bank 0.6 mile downstream from bridge on State Highway 38 in Kitzmiller, 1.5 miles downstream from Wolfden Run, and at mile 68.9.
DRAINAGE AREA.--225 sq mi.
PERIOD OF RECORD.--Water temperatures: August 1961 to September 1971.
EXTREMES.--1970-71:
Water temperatures: Maximum, 28.5°C June 28; minimum, freezing point on many days during winter months.
Period of Record:
Water temperatures: Maximum, 32.0°C Aug. 15, 16, 18, 1965; minimum, freezing point on many days during winter months.
REMARKS.--Records fair, probably because of friction in recorder. No temperature record Nov. 17 to Mar. 31.

01598500 NORTH BRANCH POTOMAC RIVER AT LUKE, MD.

LOCATION.--Lat 39°28'45", long 79°03'55", Mineral County, W. Va., temperature recorder at gaging station on right bank, 0.2 mile downstream from Savage River, 0.5 mile northwest of Luke, and at mile 53.3.
DRAINAGE AREA.--404 sq mi.
PERIOD OF RECORD.--Water temperatures: December 1961 to December 1962, July to September 1963, December 1963 to September 1971.
EXTREMES.--1970-71:
Water temperatures: Maximum, 29.5°C June 29; minimum, freezing point on many days during winter months.
Period of record:
Water temperatures: Maximum, 33.0°C July 3, 1966; minimum, freezing point on many days during winter months.
REMARKS.--Records fair, probably because of friction in recorder.

TEMPERATURE (°C) OF WATER, WATER YEAR OCTOBER 1970 TO SEPTEMBER 1971
(CONTINUOUS ETHYL ALCOHOL-ACTUATED THERMOGRAPH)

01600000 NORTH BRANCH POTOMAC RIVER NEAR CUMBERLAND, MD.

LOCATION.--Lat 39°37'16", long 78°46'24", Allegany County, at gaging station, at Wiley Ford Bridge, 2 miles south of Cumberland, 2.1 miles downstream from Wills Creek, and at mile 19.6.

DRAINAGE AREA.--875 sq mi.

PERIOD OF RECORD.--Chemical analyses: December 1964 to September 1971.
Water temperatures: October 1964 to September 1971.
Sediment records: October 1964 to September 1971.

EXTREMES.--1969-71:
Water temperatures: Maximum 31.0°C June 28; minimum, freezing point Feb. 10, and probably several other days during period of missing record.
Sediment concentrations: Maximum daily, 1,550 mg/l Dec. 22; minimum daily, 5 mg/l Aug. 27.
Sediment discharge: Maximum daily, 23,800 tons Dec. 23; minimum daily, 2.1 tons Aug. 27.

Period of record:
Water temperatures: Maximum, 33.0°C July 13, 14, 1966, July 16, 18, Aug. 19, 23, 1968; minimum freezing point on many days during winter period.
Sediment concentration: Maximum daily, 1,600 mg/l Feb. 13, 1966; minimum daily, 3 mg/l Aug. 13, 1969.
Sediment discharge: Maximum daily, 61,000 tons Mar. 6, 1967; minimum daily, 2.1 tons Aug. 27, 1971.

TOTAL DISCHARGE FOR YEAR (CFS-DAYS) 553166
TOTAL SUSPENDED-SEDIMENT DISCHARGE FOR YEAR (TONS) 187153.6

01615000 POTOMAC RIVER AT HANCOCK, MD.

LOCATION.--Lat 39°41'49", long 78°10'30", Washington County, at U. S. Highway 522 at Hancock, 0.8 mile upstream from gaging station, 0.5 mile upstream from Little Tonoloway Creek, 1.6 miles upstream from Tonoloway Creek (formerly called Great or Big Tonoloway Creek), and at mile 259.

DRAINAGE AREA.--4,073 sq mi.

PERIOD OF RECORD.--Chemical analyses: July 1969 to September 1971.
Water temperatures: July 1952 to February 1964, July 1966 to September 1971.

EXTREMES.--1970-71:
Water temperatures: Maximum, 31.0°C July 8, 10; minimum, freezing point on many days during winter period.

Period of record:
Water temperatures: Maximum, 34.0°C July 22, 1952; minimum, freezing point on many days during winter period.

REMARKS.--Records fair, probably because of friction in recorder. Temperature recorder at gaging station 0.5 mile downstream from sampling site.

01614500 CONOCOCHEAGUE CREEK AT FAIRVIEW, MD.

LOCATION.--Lat 39°42'57", long 77°49'28", Washington County, at highway bridge at Fairview, 0.7 mile downstream from gaging station, 1.3 miles upstream from Rockdale Run, 6 miles northwest of Hagerstown, and 18 miles upstream from mouth.

DRAINAGE AREA.--495 sq mi.

PERIOD OF RECORD.--Chemical analyses: October 1965 to September 1971.
Water temperatures: November 1966 to September 1971.
Sediment records: October 1966 to September 1971.

EXTREMES.--1970-71:
Water temperatures: Maximum, 26°C July 8, 9, 10, 18, Aug. 20; minimum, 1.0°C several days during winter period.
Sediment concentrations: Maximum daily, 666 mg/l June 15; minimum daily, 1 mg/l Oct. 8, 9.
Sediment discharge: Maximum daily, 4,250 tons Feb. 23; minimum daily, 0.34 ton Oct. 9.

Period of record:
Water temperatures: Maximum, 30°C July 17, 1969; minimum, freezing point on many days during winter period.
Sediment concentrations: Maximum daily, 940 mg/l Mar. 25, 1969; minimum daily, 1 mg/l, on many days during 1967, 1970, 1971.
Sediment discharge: Maximum daily, 11,000 tons Mar. 7, 1967; minimum daily, 0.17 ton Nov. 24, 26, 27, 1966.

01619500 ANTIETAM CREEK NEAR SHARPSBURG, MD.

LOCATION.--Lat 39°27'01", long 77°43'52", Washington County, temperature recorder at gaging station on left bank 400 ft downstream from Burnside Bridge, 1 mile southeast of Sharpsburg, and 4.0 miles upstream from mouth.

DRAINAGE AREA.--281 sq mi.

PERIOD OF RECORD.--Chemical analyses: August 1965 to September 1971.
Water temperatures: October 1962 to September 1971.

EXTREMES.--1970-71:
Water temperatures: Maximum, 24.0°C on several days in Aug. and Sept; minimum, 0.5°C Jan. 20, 21, Feb. 2, 3.

Period of record:
Water temperatures: Maximum, 28°C June 26, July 1-3, 1965, Aug. 21, 23, 24, 1966, June 28, 1969; freezing point on many days during winter period.

REMARKS.--Temperature records poor, probably because of friction in recorder. Chemical samples collected from Burnside Bridge.

01638500 POTOMAC RIVER AT POINT OF ROCKS, MD.

LOCATION.--Lat 39°16'26", long 77°32'35", Frederick County, at gaging station at bridge on U. S. Highway 15 at Point of Rocks, 0.5 mile downstream from Catoctin Creek (Virginia), 6 miles upstream from Monocacy River and at mile 159.8.

DRAINAGE AREA.--9,651 sq mi.

PERIOD OF RECORD.--Chemical analyses: December 1964 to September 1971.
Water temperatures: October 1960 to September 1971.
Sediment records: October 1960 to September 1971.

EXTREMES.--1970-71:
Water temperatures: Maximum, 29°C Aug. 19, Sept. 8, 6, 8, 9; minimum freezing point on several days during winter period.
Sediment concentrations: Maximum daily, 758 mg/l Feb. 15; minimum daily, 2 mg/l Dec. 8.
Sediment discharge: Maximum daily, 155,000 tons Feb. 15; minimum daily, 20 tons Dec. 8.

Period of record:
Water temperatures: Maximum, 33.5°C Aug. 24, 1964; minimum, freezing point on many days during winter period.
Sediment concentrations: Maximum daily, 2,860 mg/l Apr. 3, 1972; minimum daily, 1 mg/l on many days.
Sediment discharge: Maximum daily, 555,000 tons Apr. 3, 1972; minimum daily, 2 tons on several days during September 1964, July to September 1966, November 1967, January and December 1968, and January 1969.

TOTAL SUSPENDED-SEDIMENT DISCHARGE FOR YEAR (TONS) 1375032

01639000 MONOCACY RIVER AT BRIDGEPORT, MD.

LOCATION.--Lat 39°40'43", long 77°14'00", Frederick County, at bridge on Maryland State Highway 97, 60 feet upstream from gaging station at Bridgeport, 0.6 mile upstream from Cattail Branch, 3.4 miles northwest of Taneytown, 4.6 miles downstream from confluence of Rock and Marsh Creeks at Pennsylvania-Maryland State line, and 49 miles upstream from mouth.

DRAINAGE AREA.--173 sq mi.

PERIOD OF RECORD.--Chemical analyses: April 1948 to June 1961, July 1969 to September 1971.

01643020 MONOCACY RIVER AT REICH'S FORD BRIDGE, NEAR FREDERICK, MD.
(Formerly published as 01643000 Monocacy River at Jug Bridge, near Frederick, Md.)

LOCATION.--Lat 39°23'16", long 77°22'40", Frederick County, at Reich's Ford Bridge, 1 mile downstream from U. S. Highway 40, 1.2 miles downstream from gaging station, 2 miles southeast of Frederick, and 16.6 miles upstream from mouth.

DRAINAGE AREA.--817 sq mi, upstream from gaging station.

PERIOD OF RECORD.--Chemical analyses: December 1964 to September 1971.
Water temperatures: October 1960 to September 1971.
Sediment records: October 1960 to September 1971.

EXTREMES.--1970-71:
Water temperatures: Maximum, 29.0°C July 8; minimum, freezing point Jan. 20, 27, 31, Feb. 9, 10, and probably several other days during period of missing record.
Sediment concentrations: Maximum daily, 1,100 mg/l Feb. 14; minimum daily, 6 mg/l Jan. 13, 14.
Sediment discharge: Maximum daily, 34,500 tons Feb. 14; minimum daily, 2.90 tons Oct. 10.

Period of record:
Water temperatures: Maximum, 30.5°C July 2, 12-13, 26 Aug. 27, 1966; minimum, freezing point on many days during winter period.
Sediment concentrations: Maximum daily, 2,000 mg/l July 10, 1970; minimum daily, 1 mg/l on many days.
Sediment discharge: Maximum daily, 67,900 tons July 10, 1970; minimum daily, less than 0.50 ton on many days.

REMARKS.--No appreciable inflow between sampling point and gaging station during periods of heavy local runoff.
Records of discharge are given for station 01643000 Monocacy River at Jug Bridge, near Frederick, Md.

01650500 NORTHWEST BRANCH ANACOSTIA RIVER NEAR COLESVILLE, MD.

LOCATION.--Lat 39°03'55", long 77°01'48", Montgomery County, at gaging station 400 ft upstream from bridge on State Highway 185, 1.5 miles southwest of Colesville, 3 miles upstream from Burnt Mills, 10 miles upstream from Sligo Branch, and 12.5 miles upstream from confluence with Northeast Branch.

DRAINAGE AREA.--21.1 sq mi.

PERIOD OF RECORD.--Sediment records: October 1962 to September 1971.

EXTREMES.--1970-71:
Sediment concentrations: Maximum daily, 1,360 mg/l Feb. 13; minimum daily, 1 mg/l on several days during year.
Sediment discharge: Maximum daily, 2,740 tons Feb. 13; minimum daily, .01 ton on several days during year.

Period of record:
Sediment concentrations: Maximum daily, 4,340 mg/l Aug. 25, 1965, minimum daily, no flow on several days during August and September 1966.
Sediment discharge: Maximum daily, 4,670 tons Mar. 5, 1965; minimum daily, no flow on several days during August and September 1966.

REMARKS.--All particle-size analyses for this station are included.

03076500 YOUGHIOGHENY RIVER AT FRIENDSVILLE, MD.

LOCATION.--Lat 39°39'13", long 79°24'31", Garrett County, temperature recorder at gaging station on left bank 0.7 mile upstream from bridge on State Highway 42 at Friendsville, and 1.8 miles upstream from Bear Creek
DRAINAGE AREA.--295 sq mi.
PERIOD OF RECORD.--Water temperatures: October 1962 to September 1971.
EXTREMES.--1970-71:
Water temperatures: Maximum, 26.5°C June 27, 28; minimum, freezing point on many days during winter period.
Period of record:
Water temperatures: Maximum, 29.5°C June 27, 28, 1969; minimum, freezing point on many days during winter period.
REMARKS.--Records fair, probably because of friction in recorder.

TEMPERATURE (°C) OF WATER, WATER YEAR OCTOBER 1970 TO SEPTEMBER 1971
(CONTINUOUS ETHYL ALCOHOL-ACTUATED THERMOGRAPH)
